Provisioning EC2 Virtual Machines

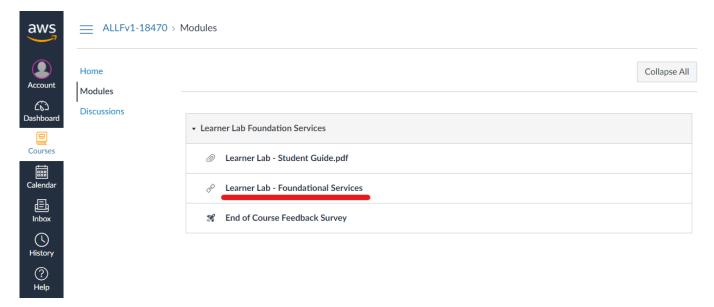

In this workshop your goal is to write Terraform code to provision an AWS EC2 virtual machine.

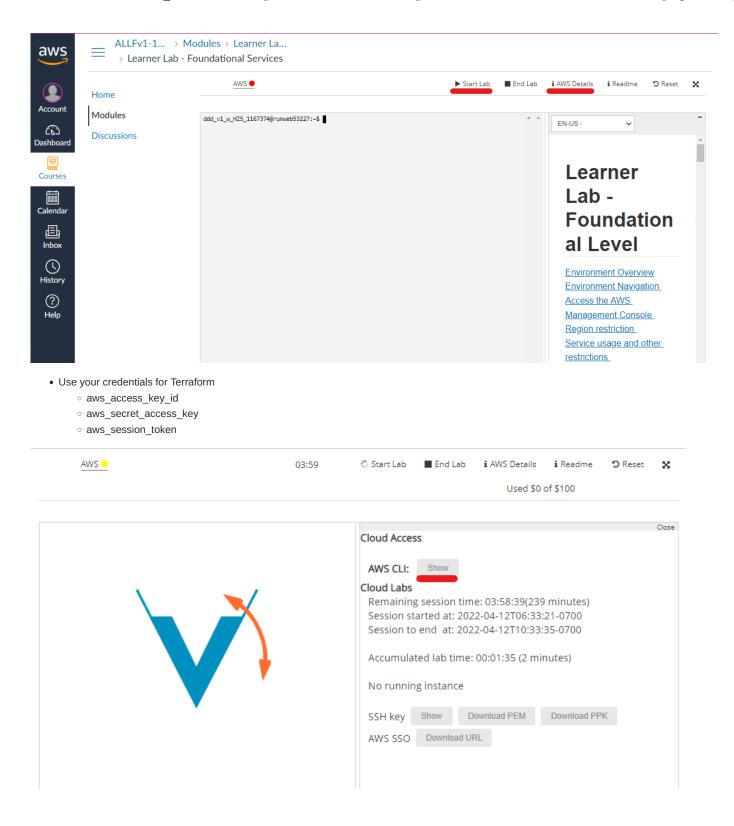

AWS Console

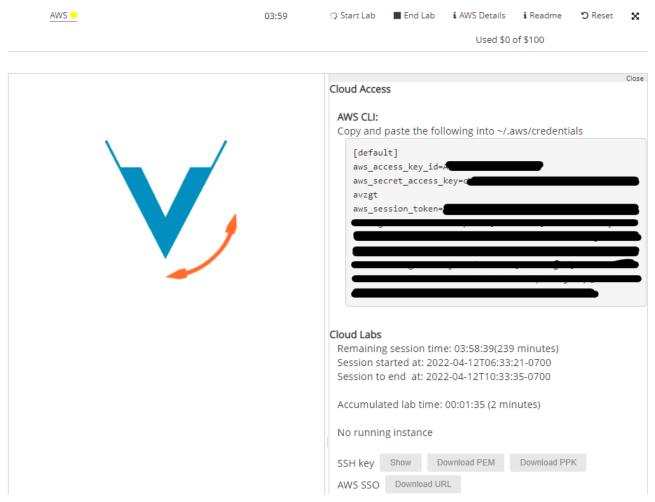

• Open AWS Academy

• Open the AWS Console in your course

Terraform

- Use the AWS provider
 - o region: us-east-1
 - o your AWS credentials
- Create a VPC
- Create an internet gateway
- Create a custom route table
- Create a subnet
- Associate subnet with route table
- Create a security group
 - o ingress: TCP port 80
 - o egress: allow everything
- Create a network interface with an IP in the subnet
- Assign an elastic IP to the network interface
- Create an AWS EC2 instance
 - o ami: Linux Ubuntu image
 - o instance type: t2 micro
 - o associate public ip address: true
 - o user data: Start an Apache web server (code below)
- Output the public IP address of the instance
 - o check if the instance is reachable

Apache web server code:

```
#!/bin/bash
sudo apt-get update
sudo apt-get install -y apache2
sudo systemctl start apache2
sudo systemctl enable apache2
sudo systemctl enable apache2
echo "<h1>Hello World</h1>" | sudo tee /var/www/html/index.html
```

Hint: Use the video linked in the self study section as a guide.

Submission

Use your .tf file(s) for the submission. Each instruction has to be commented in your own words (what is it for, what does it do). Do not copy the

BIF-VZ-5-WS2023-INFC-EN_1: 🕞 Workshop Instruction... https://moodle.technikum-wien.at/mod/page/view.php...

Terraform documentation. The final submission in Terraform Workshop 3 will include all files from the previous Terraform workshops.
